Hello Twilio Email Team,

I'm applying for the Software Engineer (L3) role on Email. Delivery systems that have to be correct and observable at volume are the kind of backend work I like.

At Coordinator I built a Go data gateway with scoped, revocable, device-bound tokens, refresh-reuse rejection, rate limits and an audit log, covered by 28 tests, and the self-hosted CI that ran the end-to-end suite on every release merge. At Ralli I built NestJS/Postgres services for games, lines, friends and notifications with live WebSocket updates and Datadog tracing, and led the team that ran them. I write Go and Python daily, and I learned to code on Java, though it has been years.

To be direct about gaps: I haven't run Kafka or email infrastructure such as MTAs, and I haven't written Terraform in production or worked on Azure. My cloud work has been AWS, GCP and managed services.

I'd be glad to talk about the role.

Jack Sturtevant
