Hello BILL Team,

I'm applying for the Senior Staff AI Security Engineer role knowing it's a stretch. I haven't held a security title, and I haven't run a formal red-team practice or built a program around the OWASP LLM Top 10.

I do build the systems this role has to secure. At Coordinator I built the agent tool layer in Go, with write tools scoped to a workspace and read-only cross-app data tools under exact contracts, plus a data gateway with scoped, revocable, device-bound tokens, refresh-token reuse rejection, rate limits, and an audit log. I also built the Python agent runtime and fine-tuned and served LLMs on H100s, so I know where these systems take in untrusted input and what they can reach.

If you could use a builder on the gateway and policy side who would grow into the attack side, I'd be glad to talk.
