Hello Cal.com Team,

I'm applying for the IC4 Senior Full-Stack Engineer role on the Foundation team. The posting asks for someone who reviews high-risk pull requests, keeps daily releases smooth, embeds with product teams, and digs into hard logic like round-robin scheduling across time zones. Your stack is the one I've built on most.

At Lancer, the freelance marketplace I founded, I wrote most of a Next.js, tRPC, and Prisma app with quotes, checkpoints, and in-app messaging, and led a 7-person team. At Ralli I rebuilt the product as a Turborepo monorepo with a Next.js web app and a NestJS server split into a dozen domain modules on Drizzle and Postgres, with live WebSocket updates and Datadog tracing. This year at Coordinator I built self-hosted CI that runs the end-to-end suite on every release merge.

I have seven years of experience, a little under the eight the posting asks for, and I'm comfortable working async with a distributed team and being on call. I'd be glad to talk about how I could help the Foundation team.
