Hello Calendly Team,

I'm applying for the Senior Full Stack Engineer, AI Scheduling role. The posting asks for products that combine probabilistic AI behavior with reliable application workflows, which is what I spent this year building.

At Coordinator I built the tools our LLM agent used to edit apps in a user's workspace and read data across their installed apps, and agent-runtime memory for both chat and voice. When our quick-edit path was slow, I timed a single-shot model call against the agent tiers on real requests. It was 4–6x faster, so I shipped it as its own tier. Before that, as founder and CTO of Ralli, I built NestJS/Drizzle/Postgres services with live WebSocket updates behind a React front end, and led the engineering team.

I have seven years of experience, including two companies where I founded and ran engineering. I'd be glad to talk about how I could help Calendly's AI scheduling team.
