Hello ClickHouse Team,

I'm applying for the Senior Software Engineer (Backend), AI/ML role. I've spent this year building the backend that sits between an LLM and real data, and I'd like to do that next to a database.

At Coordinator I built the tools our LLM agent used to edit apps in a user's workspace and read data across their installed apps, with exact tool contracts so the model called them correctly. I also built Python agent-runtime services with group-scoped memory, fine-tuned multi-sport LLMs on H100s with quantized vLLM serving, and a data gateway that gives third-party apps scoped, revocable tokens. When our quick-edit path was slow, I timed a single-shot model call against the agent tiers on real requests. It was 4–6x faster, so I shipped it as its own tier.

I haven't used ClickHouse in production; my databases have been Postgres. I'd be glad to talk about how I could help developers use ClickHouse for AI.
