Hello GitLab Team,

I'm applying for the Staff Fullstack Engineer role on Data Products. The posting asks for someone with high agency who can turn an ambiguous 0-to-1 problem into a roadmap, and who has built production AI tool orchestration. Both describe my last few years.

This year at Coordinator I built the tools our LLM agent used to edit apps in a user's workspace and read data across their installed apps, and when the quick-edit path was slow I timed it against a single model call on real requests; the single call was 4-6x faster, so I shipped it as its own tier. I also built a Go data gateway with scoped, revocable tokens that grew into an app store with per-app data storage. At Ralli, the company I founded, I built the pipeline that loaded betting lines and rosters from ESPN's APIs into Postgres, and led the engineering team.

To be direct about gaps: I haven't written Ruby professionally, I haven't built a knowledge graph or warehouse integrations, and my leadership has been across small teams rather than many. I'd be glad to talk about whether that fits what the team needs.
