Hello GitLab Team,

I'm applying for the Staff Fullstack Engineer role on the Purchase team. The posting asks for experience with checkout-style flows, a bias toward safe, incremental delivery, and clear technical direction for a product area. Most of what I've built has had money moving through it, and I've run engineering at two companies I founded.

At Lancer, the freelance marketplace I founded, I built the flow from quote to checkpoint to payment: funds sat in escrow until the client approved the work, and I integrated ACH payouts through Coinflow so freelancers without crypto could get paid; 55 clients funded 264 escrows. As interim CTO at Banger I built a trading platform end to end in eight weeks, which led to a $250K raise. At Applied Intuition, a license dashboard I built showing customers' product usage helped close multiple million-dollar deals.

I haven't used Ruby on Rails or Vue.js professionally; my front ends have been React and TypeScript, and my backends Node, Go, and Python. I'd be glad to talk about how I could help the Purchase team.
