Hello Render Team,

I'm applying for the Software Engineer, Expansion role. The team builds tools that help larger teams manage their apps as they grow, and I've built that kind of tool before: at Applied Intuition, an intranet for managing developers, teams, and customers, and a license dashboard showing customers' product usage that helped close multiple million-dollar deals.

This year at Coordinator I built a Go data gateway with scoped, revocable tokens that grew into a third-party app store, the tools our LLM agent used to act on a user's workspace, and self-hosted CI that runs the end-to-end suite on every release merge. Before that I founded Ralli, a real-time social betting app, where I built NestJS and Postgres services behind a Next.js app with live WebSocket updates and Datadog tracing, and led the engineering team.

I've spent most of my seven years at small, fast-moving startups, wearing whichever hat the week needed. I'd be glad to talk about how I could help Render.
