Hello Stripe Team,

I'm applying for the Software Engineer role on Revenue and Financial Automation. The posting asks for a backend engineer with an entrepreneurial streak who works directly with users, and it lists usage-based billing and financial systems as a plus. I've built payment and settlement systems as a founder, and I'd like to work on them at Stripe's scale.

At Lancer, the freelance marketplace I founded, I wrote the escrow program with dispute resolution and vote-to-cancel, and added ACH payouts so freelancers without crypto could get paid; 55 clients funded 264 escrows. At Ralli I built NestJS and Postgres services with live WebSocket updates and Datadog tracing, plus the programs that submitted bets and resolved lines. This year at Coordinator I built a Go data gateway with scoped, revocable tokens, rate limits, and an audit log, which grew into a third-party app store.

My systems have been startup scale, not Stripe scale, and I'd expect to learn a lot about running distributed systems at that size. I'd be glad to talk about how I could help the Revenue and Financial Automation team.
