Hello SoFi Data Platform Team,

I'm applying for the Principal Software Engineer role in Data Trust and AI Context. I live in Utah, and the problem this role names (data that AI can rely on, with the context to use it well) is the one I kept running into this year.

At Coordinator I built the pipeline that turned reviewed production turns into training data, a video pipeline with clips on MinIO and metadata in Postgres feeding model scoring, and a data gateway with scoped, revocable tokens and an audit log so third-party apps only saw what they were allowed to. At Ralli I designed the Postgres data model and the ingestion cadence for live sports data.

To be direct about gaps: this is a Principal role and I have seven years. I haven't worked with Snowflake, Kafka-based ingestion, or catalog and lineage tools, and my data work has been at startup scale.

I'd be glad to talk about whether there is a fit on the team, at this level or another.
