Hello Toast Voice AI Team,

I'm applying for the Staff/Senior Software Engineer role on the Voice AI Platform. Voice AI for restaurants has to work under real noise and real latency, and that's where I did my hardest work this year.

At Coordinator I self-hosted Whisper speech-to-text and several TTS engines, benchmarked them on latency and compatibility, swapped engines on the data, and shipped production voice messaging in the web app. I built the agent runtime around it, with voice-agent memory and Go tools with exact contracts, and I handled non-deterministic output by measuring it: scoring harnesses for model quality, and timing agent tiers on real requests to route simpler requests to a 4-6x faster path.

To be direct about gaps: the posting asks for eight years in Java or Kotlin. I learned to code on Java but haven't used it in years, and my recent backends are Go, Python and TypeScript. I have seven years, so I'd expect the Senior level.

I'd be glad to talk about the role.
