Hello Shopify Team,

I'm applying for the Applied ML Engineering role on GenAI and AI Agents. An AI personal shopper needs exactly the pieces I built this year: fine-tuning data, tuned models, and an agent that uses them well.

At Coordinator I built the pipeline that turned reviewed production turns into training data, fine-tuned LLMs on H100s with a feedback-retraining loop, and served them quantized with vLLM. I built the agent runtime around them, with memory, Go tools with exact contracts, and a single-shot tier I added after timing real requests showed it was 4-6x faster than the agent loop for many of them. Before that I built ETL pipelines into Postgres at Ralli.

To be direct about gaps: I haven't used dbt or BigQuery, and my agents served a startup's users rather than commerce at Shopify's scale.

I'd be glad to talk about the role.
