Hello GitLab Subscription Lifecycle Team,

I'm applying for the Intermediate Fullstack Engineer role on Subscription Lifecycle. Post-purchase flows where money changes hands are the part of a product I most like getting right, and I've built them twice as a founder.

At Lancer I built escrowed payments with ACH payouts, quotes, checkpoints and in-app messaging, and led the 7-person team that shipped it. At Ralli I built bet submission and settlement on NestJS and Postgres, plus the Next.js app on top. Most recently, at Coordinator, I built a Go data gateway with scoped, revocable tokens and an audit log, and the CI that ran our end-to-end suite on every release merge. I work asynchronously by default and write things down.

To be direct about the main gap: I haven't shipped Ruby on Rails in production, and the posting lists it as a must-have. My stacks have been TypeScript, Go and Python, and I've picked up each new one quickly. I'd also be coming in above the intermediate level in scope, which I'm comfortable with.

I'd be glad to talk about the role.
